Steps for creating a Process Flow to use Web Service

1. Create Web Service Consumer activity.
2. Create Source Activity for fetching the source file.(e.g. File Source)
3. Create schema as per the format of the input file.
4. Create XML Schema to input XML format required by Web Service.
    a. While creating XML Schema, select *Web Service Consumer* radio button.
    b. In the Consumer ID drop-down list, select the web service consumer activity.
    c. In the XSD type drop down list, select *Input.*

5. Create Mapping using these schemas. The XML schema should be at the target end in the mapping.
6. Create Target activity store the output of Web Service Consumer.
7. Using these activities to create the process flow as shown below:

Source Activity -> Source Schema -> Mapping (Input for Web Service) -> Consumer Activity -> Target Activity

Note: Use multiple streams to create a stream from consumer activity to target activity.
